# KANBAN

Successful Evolutionary Change  
for Your Technology Business

**David J. Anderson**

Foreword by Donald G. Reinertsen

## Why KANBAN ?

Many longstanding  
PM Issues:

Fundamentally, its about

**Greater productivity**

**Higher quality work**

**Sustainable pace**

**Scaling of Agile adoption**

## Why “one size fits all” development methodologies don't always work

### TEAMS have different ...

- Skill Sets
- Levels of Experience
- Levels of Capability

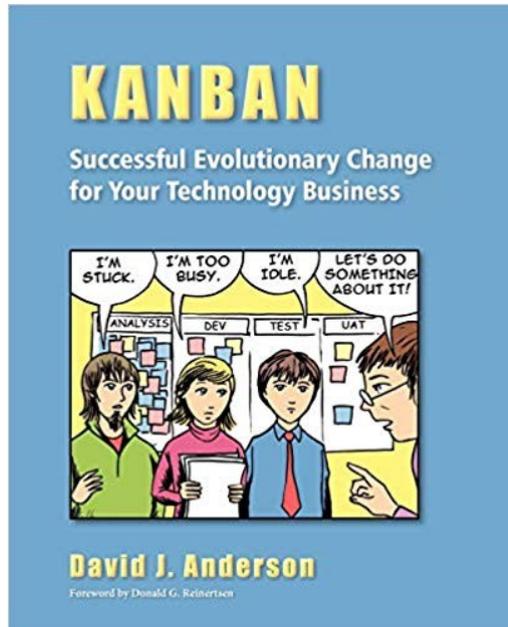

### PROJECTS have different ...

- Budgets
- Schedules
- Scopes
- Risk Profiles
- Changing Requirements

### ORGANIZATIONS have different ...

- Value Chains
- Target Markets
- **Corporate Culture**

In some way, **USUALLY every situation is unique ...**  
**Building HWY 407 or the Hoover Dam is not the same as**  
**creating a new software application**

## Takeaways:

**Kanban systems are from a family of approaches known as “pull” systems.**

**Eliyahu Goldratt's Theory of Constraints is one. [ *The Goal*, 1984 ]**

## Motivation:

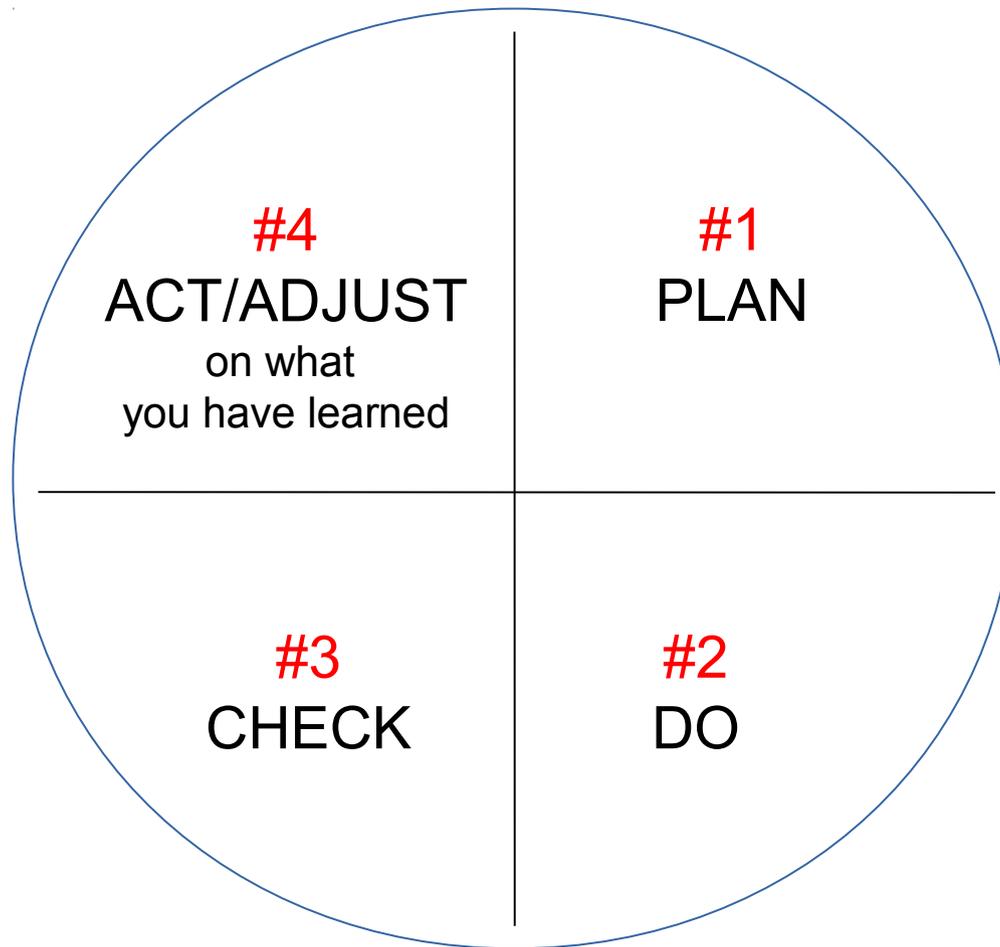

- to achieve a sustainable pace of work
- introduce process changes with minimal resistance.

**Underpins the Toyota Production System and its *kaizen* approach to continuous improvement.**

**Microsoft implemented the first virtual system for software engineering in 2004.**

**Growth in adoption began after the Agile conference in Washington, D.C. in August 2007.**

~ 100 years in the making ...

- **Remember: The newer IID processes have evolved from the Shewhart PDCA cycle** developed by Walter Shewhart in the **1920s** for the improvement of general business processes. He is the father of the concept of “continuous improvement” which was further developed in the 1950s by Edwards Deming who applied it in Japan after the war to produce low cost goods for the rest of the world.

**Kan-ban** is a Japanese word for “**signal card**” ...  
a new piece of work can only be started when a card is available.

This free card is attached to a piece of work and follows it  
as it flows through the system.

**When there are no more free cards, no additional work can be started.**

Any new work must wait in a queue until a card becomes available.

This mechanism is known as a **pull system** because new work is  
pulled into the system **when there is capacity to handle it** ...  
rather than being pushed into the system based on demand.

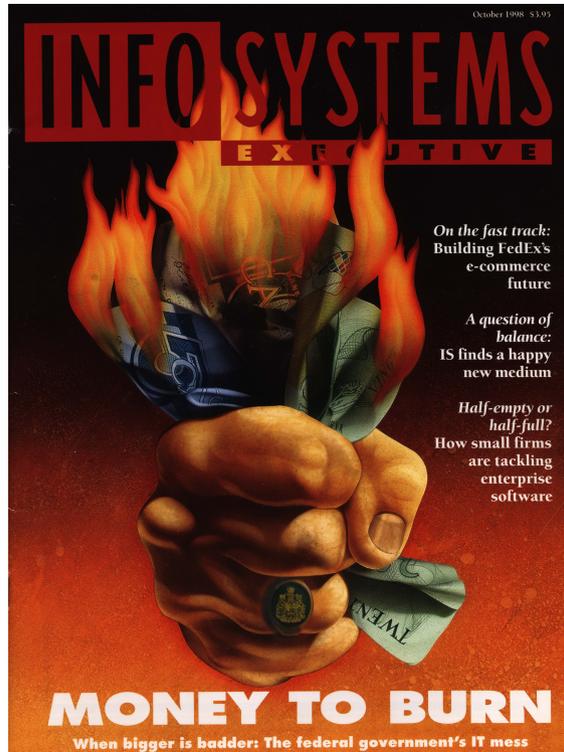

A pull system cannot be overloaded if the capacity, as determined by the  
number of signal cards in circulation, has been set appropriately.

### 1.5 Scrum vs. Traditional Project Management

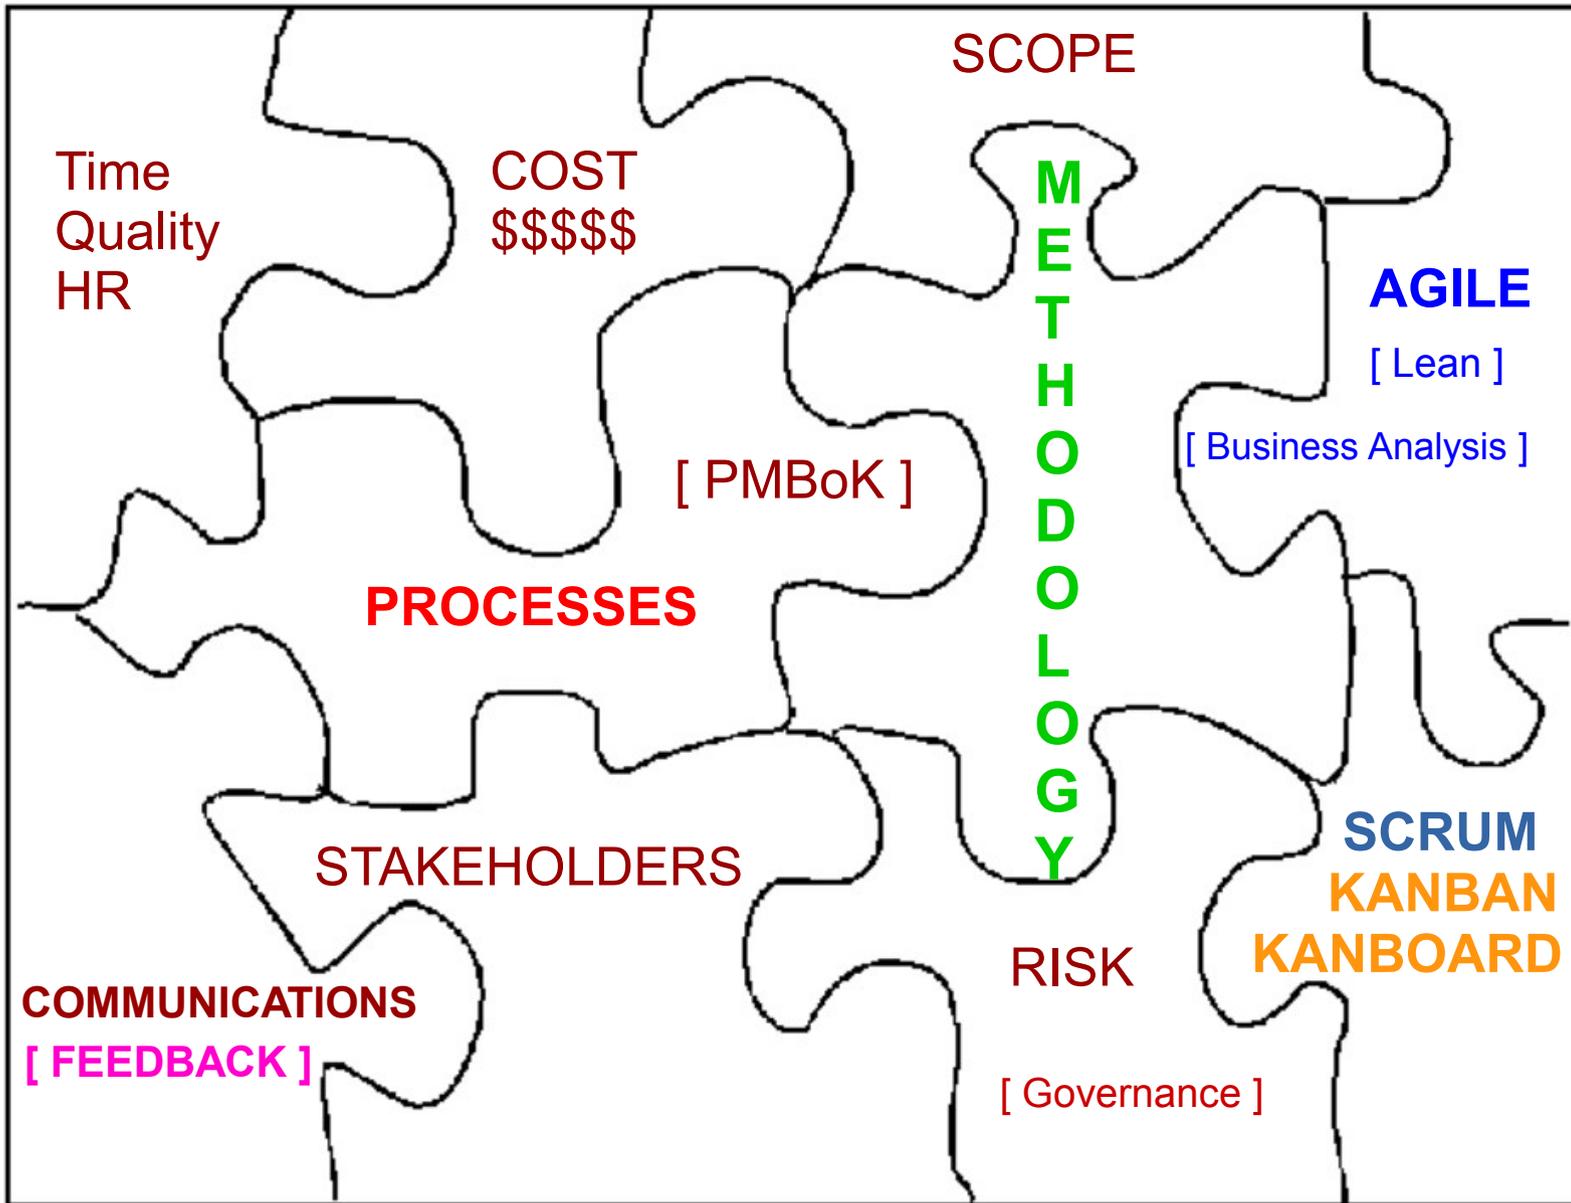

Table 1-3 summarizes many of the differences between Scrum and traditional project management models.

	Scrum	Traditional Project Management
Emphasis is on	People	Processes
Documentation	Minimal—only as required	Comprehensive
Process style	Iterative	Linear
Upfront planning	Low	High
Prioritization of Requirements	Based on business value and regularly updated	Fixed in the Project Plan
Quality assurance	Customer centric	Process centric
Organization	Self-organized	Managed
Management style	Decentralized	Centralized
Change	Updates to Productized Product Backlog	Formal Change Management System
Leadership	Collaborative, Servant Leadership	Command and control
Performance measurement	Business value	Plan conformity
Return on Investment (ROI)	Early/throughout project life	End of project life
Customer involvement	High throughout the project	Varies depending on the project lifecycle

# Defined versus Empirical Process Models

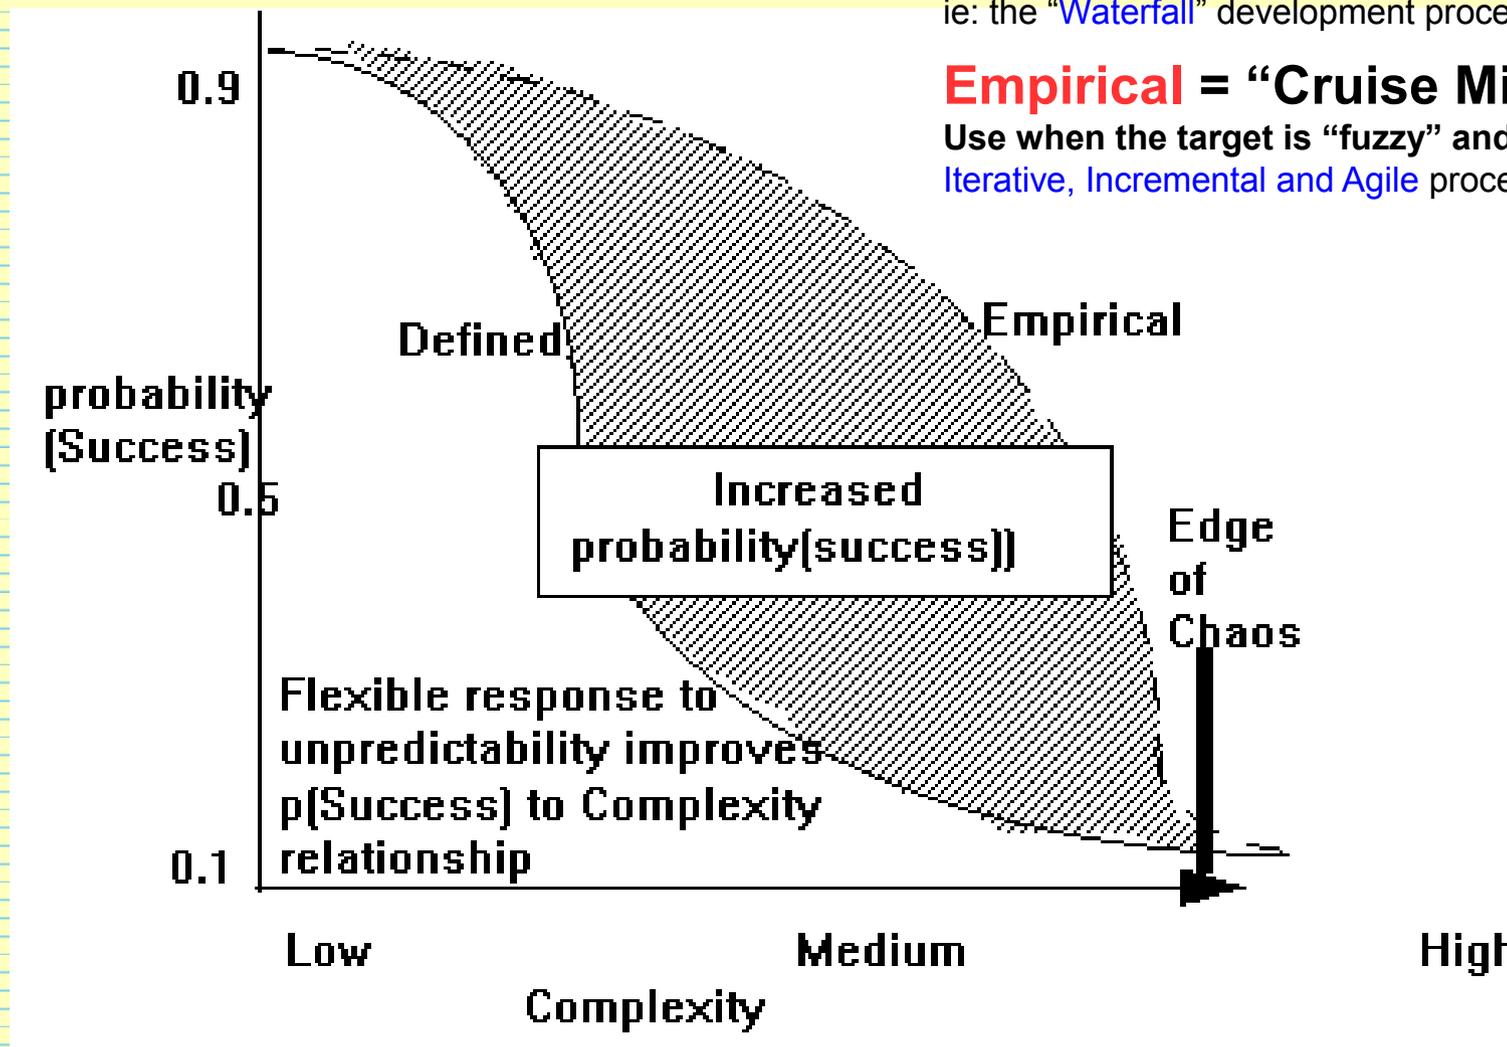

## Defined = “Rifle” Approach

Use when the target is known and well defined  
ie: the “Waterfall” development process.

## Empirical = “Cruise Missile” Approach

Use when the target is “fuzzy” and not clear.

Iterative, Incremental and Agile processes are good options.

# To recap:

Agile methods, at their core, are all about managing the impact of change on a project.

- ◆ **Iterative and Incremental Development**  
Each iteration builds upon the last, adding additional layers of functionality.
- ◆ **Short Iterations**  
More responsiveness to change, and reducing the risk of building “the wrong thing” based on unclear or changing requirements.
- ◆ **Progress Measured via Completed Features**
- ◆ **Open, Flexible Design**  
Designs are flexible and extensible using **open standards** wherever possible.
- ◆ **Empowered Teams:** Teams of specialists who know their jobs well.
- ◆ **Personal Communications**  
Speaking face to face, with the support of a whiteboard for drawing diagrams, is a much more efficient way of working out design details.

# It's all about:

## Reducing Risk

- Building the Wrong Thing
- Building the right thing **Wrong**
- Getting Stuck in “Design Churn”

## Improving Control

- Frequent delivery of working code means progress is objectively measurable
- More chances for stakeholders to provide early feedback and redirect project priorities where necessary
- Misunderstanding surfaces earlier
- The sponsor has the ability to end a project early and still get measurable benefits.

- **The “Agile Manifesto”:**
  - **Individuals and Interaction**  
over process and tools
  - **Working software**  
over comprehensive documentation
  - **Customer collaboration**  
over contract negotiation
  - **Responding to change**  
over following a plan

# lean The 7 Wastes

Identified in the Toyota Production System

**Figure 1.1.** The seven lean wastes of software development: the seven wastes were identified in manufacturing in the Toyota Production System by Shigeo Shingo, then *translated* to software development by Mary and Tom Poppendieck

**Table 1.1** Lean wastes: Shigeo Shingo (1981) identified seven wastes of manufacturing and Mary and Tom Poppendieck (2007) translated these into waste in software development. For an agile BA with keen eyes toward eliminating waste, this list offers a gold mine of opportunity

The Seven Wastes of Manufacturing	The Seven Wastes of Software Development
Overproduction	Partially done work
Inventory	Extra features
Extra processing	Relearning
Transportation	Handovers
Motion	Task switching
Waiting	Delays
Defects	Defects

## Combating Waste

To better understand agile principles and concepts, it is important to review the ways lean attempts to fight waste. For that, we need to check the underlying reasons behind the waste and think about ways to reduce or eliminate that waste.

The 10 key practices:

### Eliminate Waste

– especially things that don't add value to the final deliverable

### Minimize Inventory

– intermediate artifacts like requirements & design documents

**Maximize Flow** – use iterative development

**Pull from Demand** – support flexible requirements

### Empower Workers

– tell developers what needs to be done not how to do it

### Meet Customer Requirements

**Do it right the first time** – test early

**Abolish Local Optimization** – flexibly manage scope

**Partner with Suppliers** – avoid adversarial relationships

### Create a culture of Continuous Improvement
